GHOOMI

COMPLETE PRODUCT VISION, FUNCTIONAL REQUIREMENTS & THREE-PART DEVELOPMENT ROADMAP

Product Name: Ghoomi

Product Category: Smart Travel Planning, Discovery, Booking & Management Platform

Brand Statement: You Enjoy the Journey. Ghoomi Manages the Journey.

Vision: From Home to Home.

Document Type: Master Product Concept, Technical Requirements, Functional Modules, Development Phases and Future Expansion Roadmap.

TABLE OF CONTENTS

PART A — PRODUCT FOUNDATION & OVERALL VISION

1. Introduction to Ghoomi
2. Product Vision and Mission
3. Problems Ghoomi Solves
4. Ghoomi's Core Solution
5. Overall Product Architecture
6. Three Major Development Partitions
7. Target Users
8. Complete User Journey
9. Business and Revenue Model
10. Core Technical Architecture

PART B — PARTITION 1: BEFORE FIRST DEPLOYMENT

11. Partition 1 Overview
12. User Registration and Authentication
13. User Profile and Traveller Management
14. Main Website and Home Page
15. Destination Search and Discovery
16. Holiday and Trip Creation
17. AI Smart Trip Planner
18. AI Itinerary Generation
19. AI Budget Estimation and Optimization
20. Transportation Discovery

21. Flight Discovery
22. Train Discovery
23. Bus Discovery
24. Cab and Taxi Discovery
25. Own Vehicle and Rental Vehicle Options
26. Accommodation Discovery
27. Hotel and Resort Comparison
28. Food and Restaurant Discovery
29. Activities and Attractions Discovery
30. Destination Information
31. Trip Customization
32. Unified Trip Dashboard
33. Basic Booking and Reservation Integration
34. Basic Payment and Cost Summary
35. Basic Safety Features
36. Basic Notifications
37. Basic Customer Support
38. Admin Dashboard
39. Initial Partner Integration
40. Partition 1 Page-wise Development Structure
41. Partition 1 Technical Requirements
42. Partition 1 Priority and Development Sequence
43. First Deployment Completion Criteria

PART C — PARTITION 2: AFTER FIRST DEPLOYMENT

44. Partition 2 Overview
45. Expanded Direct Booking System
46. Advanced Payment Management
47. Booking Lifecycle Management
48. Cancellation and Refund Management
49. Group Travel Coordination
50. Family Monitoring and Location Sharing
51. Live Trip Updates
52. Advanced Trip Tracking
53. Document Storage
54. Advanced Notifications
55. Advanced Customer Support
56. Partner Management Expansion
57. Advanced Admin Dashboard
58. Partition 2 Page-wise Development Structure
59. Partition 2 Technical Requirements
60. Partition 2 Priority and Development Sequence

PART D — PARTITION 3: LONG-TERM EXPANSION

61. Partition 3 Overview
62. Intelligent Trip Recovery
63. Back-to-Home System

64. Advanced Safety Coordination
65. Emergency and SOS Ecosystem
66. Advanced AI Travel Assistant
67. Advanced Destination and Event Intelligence
68. Advanced Weather Intelligence
69. Advanced Group Expense Splitting
70. Offline Travel Mode
71. Secure Document Wallet
72. Public Travel Experiences
73. Travel Memories and Social Community
74. Ghoomi Explore
75. Advanced Partner Marketplace
76. Premium Membership
77. Advanced Financial Ecosystem
78. Future Analytics and Intelligence
79. Partition 3 Page-wise Development Structure
80. Partition 3 Technical Requirements
81. Partition 3 Priority and Development Sequence

PART E — CROSS-PLATFORM TECHNICAL, OPERATIONAL & BUSINESS REQUIREMENTS

82. API Management and Integration Architecture
83. Database Architecture
84. Authentication and Authorization
85. Permission and Access Management
86. AI Integration Architecture
87. Real-Time Data and Inventory Management
88. Failure Handling and Recovery
89. Security and Privacy
90. Legal and Compliance Requirements
91. UI/UX and Responsive Design
92. Testing and Quality Assurance
93. Deployment and Infrastructure
94. Monitoring and Maintenance
95. Final Product Vision and Conclusion

PART A — PRODUCT FOUNDATION & OVERALL VISION

1. INTRODUCTION TO GHOOMI

Ghoomi is a smart travel planning, discovery, booking and management platform designed to bring the major services required for travelling together in one connected digital platform.

Currently, travellers depend on multiple websites and applications for different travel requirements. They may use MakeMyTrip for flight and hotel discovery, railway platforms for train tickets, bus booking websites, cab applications, restaurant platforms and separate websites for destination activities.

Managing these services independently creates inconvenience, fragmented information, repeated searching and difficulty organizing the complete journey.

Ghoomi aims to reduce this fragmentation by connecting the major travel services through one platform.

The initial product will focus on the essential travel planning and discovery features users already expect from established travel platforms. It will also introduce AI-powered trip planning, itinerary generation and budget estimation as part of the first development partition.

After the first deployment, the platform will expand its booking capabilities, live coordination, family monitoring, document management and operational services.

The long-term vision is to develop Ghoomi into an intelligent travel ecosystem capable of helping users manage their journey from departure to return.

2. PRODUCT VISION AND MISSION

Vision: To develop a connected intelligent travel platform that simplifies and organizes the complete travel experience, from leaving home to returning home.

Mission: To bring travel discovery, transportation, accommodation, food, activities, AI-based planning, budgeting and journey management together through a single platform.

Ghoomi should gradually reduce the need for users to manage separate travel applications and manually coordinate different parts of their journey.

Core Brand Promise: You Enjoy the Journey. Ghoomi Manages the Journey.

3. PROBLEMS GHOOMI SOLVES

Existing Problem	Ghoomi Solution
Different websites for transportation	Unified transportation discovery
Separate hotel platforms	Central accommodation discovery
Separate restaurant applications	Food and restaurant discovery
Difficulty planning complete holidays	AI-assisted holiday planning
Manual itinerary creation	AI-generated trip itinerary
Unclear total trip cost	Budget estimation and optimization
Difficulty comparing services	Centralized comparison
Scattered booking information	Unified trip dashboard
Difficulty finding destination activities	Destination and activity discovery
Manual trip customization	Personalized trip planning
Multiple disconnected travel services	Connected travel experience

4. GHOOMI'S CORE SOLUTION

Ghoomi will combine the following essential services:

Category	Function
Travel Discovery	Discover destinations and travel options
Holiday Planning	Create and customize trips
AI Trip Planner	Generate intelligent travel plans
Transportation	Discover flights, trains, buses and cabs
Accommodation	Discover hotels, resorts and stays
Food	Find restaurants and local cuisine
Activities	Discover attractions and experiences
Budget	Estimate overall travel expenses
Trip Dashboard	Manage the complete trip
Booking	Access supported reservation flows
Safety	Provide essential travel safety information
Administration	Manage users, partners and operations

5. OVERALL PRODUCT ARCHITECTURE

Ghoomi will have a common platform foundation with multiple functional modules.

The system should be modular so that new features can be added without rebuilding the complete application.

Main architecture:

1. User Interface Layer
2. Authentication and Account Layer
3. Trip Management Layer
4. Search and Discovery Layer

5. AI Planning Layer
6. Transportation Integration Layer
7. Accommodation Integration Layer
8. Food and Activity Layer
9. Booking and Payment Layer
10. Notification Layer
11. Safety and Tracking Layer
12. Admin and Partner Layer
13. Database and Storage Layer
14. External API Integration Layer

The first deployment will use the modules necessary for the initial product. Additional modules will be activated in later partitions.

6. THREE MAJOR DEVELOPMENT PARTITIONS

Ghoomi will be developed through three major product partitions.

These partitions define when features will be introduced, rather than separating the platform into unrelated products.

6.1 PARTITION 1 — BEFORE FIRST DEPLOYMENT

Objective: Build and deploy the first complete usable version of Ghoomi.

This partition will include:

- User registration and authentication.
- User profile and traveller information.
- Flight, train, bus and cab discovery.
- Hotel and accommodation discovery.
- Holiday and trip planning.
- Trip customization.
- AI-based itinerary generation.
- AI-based budget estimation.
- Transportation comparison.
- Accommodation comparison.
- Food and restaurant discovery.
- Activities and destination discovery.
- Unified trip dashboard.
- Basic booking and reservation workflows wherever authorized partner integrations are available.
- Supported payment initiation and payment status handling where available.
- Basic safety information and emergency contact setup.
- Basic notifications.
- Basic customer support.
- Admin dashboard.
- Initial partner integrations.

The first deployment should provide a complete and usable travel planning experience without requiring every advanced future feature.

6.2 PARTITION 2 — AFTER FIRST DEPLOYMENT

Objective: Expand operational capabilities after the first version is live.

This partition will introduce:

- Expanded direct booking capabilities.
- More transportation and hotel integrations.
- Advanced payment management.
- Complete booking lifecycle management.
- Cancellation and refund workflows.
- Group travel coordination.
- Family monitoring with consent.
- Authorized location sharing.
- Live trip updates.
- Advanced trip tracking.
- Document storage.
- Advanced notifications.
- Improved customer support.
- Expanded partner dashboard.
- Advanced admin operations.

These features will improve the ability to manage real bookings and actual journeys after users begin using Ghoomi.

6.3 PARTITION 3 — LONG-TERM EXPANSION

Objective: Transform Ghoomi into a larger intelligent travel ecosystem.

This partition will introduce:

- Intelligent trip recovery.
- Back-to-Home.
- Advanced safety coordination.
- Emergency and SOS ecosystem.
- Advanced AI travel assistance.
- Live destination and event intelligence.
- Advanced weather intelligence.
- Group expense splitting.
- Offline travel mode.
- Secure document wallet.
- Public travel experiences.
- Travel memories and social community.
- Ghoomi Explore.
- Advanced partner marketplace.
- Premium membership.

- Advanced financial ecosystem.
- Advanced analytics and business intelligence.

These features will be developed gradually according to user demand, technical feasibility and business requirements.

7. TARGET USERS

User Category	Main Requirements
Solo Travellers	Independent trip planning
Friends	Shared holiday planning
Families	Transportation, accommodation and safety
Students	Budget-friendly travel
Couples	Customized travel experiences
General Travellers	Complete trip organization
Travel Partners	Service listing and bookings
Administrators	Platform management

8. COMPLETE USER JOURNEY

The overall Ghoomi journey will follow this structure:

Open Ghoomi → Register / Login → Search Destination → Create Holiday → Enter Preferences → AI Trip Planning → Compare Transportation → Discover Accommodation → Explore Food and Activities → Review Budget → Customize Trip → Save Plan → Complete Supported Booking → Manage Trip → Travel → Return Home.

Advanced journey monitoring, intelligent recovery, family coordination and Back-to-Home will be expanded through later partitions.

9. BUSINESS AND REVENUE MODEL

Ghoomi's initial proposed revenue model will primarily operate on a commission basis.

The platform will establish agreements with different service providers, such as:

- Hotels
- Resorts
- Transportation companies
- Cab providers
- Activity organizers
- Restaurants
- Travel companies

When a user completes an eligible booking through Ghoomi, the platform may receive an agreed commission from the respective partner.

Additional possible revenue sources include:

Revenue Source	Description
Partner Commission	Revenue from eligible bookings
Platform Service Fee	Additional disclosed user charges
Convenience Fee	Applicable booking-related charges
Premium Membership	Future subscription revenue
Featured Listings	Paid promotional placements
Partner Services	Future business services

The platform may also charge additional fees for selected advanced services or premium features.

The exact commission rates, platform fees, user charges and membership prices are not fixed at this stage. They will be finalized after partner negotiations, market research and business validation.

10. CORE TECHNICAL ARCHITECTURE

The initial system should be designed using a modular architecture.

Possible technology choices:

Layer	Suggested Technology
Frontend	React.js / Next.js
UI	HTML, CSS, JavaScript, Tailwind CSS
Backend	Java Spring Boot
Database	MySQL / PostgreSQL
Authentication	Spring Security, JWT
API Communication	REST APIs
External Integrations	Authorized third-party APIs
Maps	Google Maps Platform or alternatives
AI	Authorized LLM and recommendation APIs
File Storage	Secure cloud object storage
Payment	Authorized payment gateway
Testing	JUnit, Postman, frontend testing tools
Version Control	Git and GitHub
Deployment	Cloud hosting and managed infrastructure
Monitoring	Application logs and error monitoring

Technology choices may be adjusted according to the final architecture and team capabilities.

PART B — PARTITION 1: BEFORE FIRST DEPLOYMENT

11. PARTITION 1 OVERVIEW

Development Stage: Initial Product Development

Priority: P0 — Critical Foundation

Partition 1 is the first major development target of Ghoomi.

Its purpose is to establish the main product that users can actually access and use.

It should not be treated as a simple landing page or a static demonstration.

The first version must have working user accounts, trip creation, discovery, AI-assisted planning, comparison, budget estimation and a unified dashboard.

Actual reservations and payments should be supported wherever authorized integrations and commercial agreements make them possible.

12. USER REGISTRATION AND AUTHENTICATION

Users must be able to create and securely access their Ghoomi accounts.

Features:

- Sign Up
- Login
- Logout
- Email Verification
- Mobile Verification where required
- Password Reset
- Secure Session Management
- JWT Authentication
- Account Profile
- Basic Account Settings

The system must validate user information and protect account access.

13. USER PROFILE AND TRAVELLER MANAGEMENT

The user profile will contain:

- Full Name
- Email
- Mobile Number
- Profile Photo
- Date of Birth where required
- Basic Travel Preferences
- Saved Traveller Information
- Emergency Contact Details

For booking-related operations, the platform will collect passenger and guest information required by the selected provider.

The system should avoid unnecessary collection of personal information.

14. MAIN WEBSITE AND HOME PAGE

The main home page should introduce Ghoomi and provide access to the essential travel modules.

Main components:

Component	Function
Navigation Bar	Access platform sections
Ghoomi Branding	Product identity
Login / Sign Up	Account access
Destination Search	Find destinations
Holiday Planner	Start a trip
Flight Section	Flight discovery
Train Section	Train discovery
Bus Section	Bus discovery
Cab Section	Cab discovery
Hotel Section	Accommodation discovery
Food Section	Restaurant discovery
Activities Section	Attractions and activities
Popular Destinations	Travel inspiration
Featured Offers	Verified offers
Footer	Contact, policies and information

The interface must be responsive for desktop, tablet and mobile devices.

15. DESTINATION SEARCH AND DISCOVERY

Users should be able to search for destinations and explore relevant travel services.

Search inputs:

- Starting Location
- Destination
- Departure Date
- Return Date
- Number of Travellers
- Trip Type
- Budget Preference

Search results should be filterable and sortable according to relevant information.

Possible filters include:

- Price
- Distance
- Duration
- Ratings
- Availability
- Category
- Location
- Provider
- Travel Preferences

Search results must be based on actual available data wherever live inventory is required.

16. HOLIDAY AND TRIP CREATION

Users should be able to create a complete holiday plan.

Example:

Mumbai to Goa

- Departure: 15 October
- Return: 20 October
- Travellers: 4
- Budget: ₹30,000
- Trip Type: Family Holiday

The system should save the trip and allow the user to modify the selected information.

17. AI SMART TRIP PLANNER

Priority: P0 — Core Differentiating Feature

AI-powered trip planning will be included before the first deployment.

The system should analyze:

- Starting location
- Destination
- Travel dates
- Number of travellers
- Total budget
- Traveller preferences
- Accommodation quality
- Transportation preferences
- Food preferences
- Activities
- Available time
- Comfort requirements

The AI planner should recommend a suitable trip structure based on the user's requirements.

It should not simply generate generic travel suggestions. It should use available destination, provider, pricing and availability information wherever possible.

18. AI ITINERARY GENERATION

The AI system should generate a day-wise trip itinerary.

Example:

Day	Planned Schedule
Day 1	Arrival, hotel check-in and local exploration
Day 2	Tourist attractions and sightseeing
Day 3	Adventure activities and local food
Day 4	Shopping and destination exploration
Day 5	Checkout and return journey

The AI should consider:

- Distance between places
- Estimated travel time
- Opening hours where verified
- Activity duration
- Weather information where available
- User preferences

- Budget
- Available time

Users should be able to accept, reject or modify recommendations.

19. AI BUDGET ESTIMATION AND OPTIMIZATION

The AI system should estimate the overall trip cost.

Main cost categories:

- Transportation
- Accommodation
- Food
- Activities
- Local Transportation
- Other Expenses

The platform should calculate the estimated total and compare it against the user's budget.

Budget Preference Engine

The recommendation engine should consider different budget levels.

Budget Category	Recommendation Approach
Low Budget	Economical transport, affordable stays and budget food
Medium Budget	Balanced quality, comfort and price
High Budget	Premium hotels, better transport and quality experiences

For medium budgets, users should be able to prioritize categories.

Example:

- Hotel: Premium
- Transportation: Economical
- Food: Standard
- Activities: Premium

Alternatively, users can allow AI to select the best balanced combination.

Budget Optimization Workflow

1. User enters the budget.
2. AI estimates the expected trip cost.
3. System compares selected services.
4. AI identifies expensive categories.

5. Alternative services are recommended.
6. Potential savings are calculated.
7. User reviews the revised budget.
8. User selects the preferred plan.

AI-generated estimates must be distinguished from confirmed provider prices.

20. TRANSPORTATION DISCOVERY

Transportation discovery will combine the major transport categories within Ghoomi.

Supported categories:

- Flights
- Trains
- Buses
- Cabs and Taxis
- Rental Vehicles where available
- Own Vehicle

Ghoomi should display relevant transportation information from authorized provider systems.

Users should be able to compare options without visiting multiple unrelated websites.

21. FLIGHT DISCOVERY

Features:

- Source and destination
- Departure and return dates
- Passenger count
- Available flights
- Departure and arrival times
- Duration
- Airline
- Fare
- Baggage information where available
- Fare conditions
- Comparison

The system should support booking through authorized APIs or supported booking interfaces.

22. TRAIN DISCOVERY

Features:

- Source station
- Destination station
- Journey date
- Available trains
- Train timing
- Duration
- Available classes
- Fare information
- Seat availability where supported

Actual train booking requires an authorized railway or booking-provider integration.

23. BUS DISCOVERY

Features:

- Source
- Destination
- Date
- Bus operator
- Bus type
- Departure time
- Arrival time
- Fare
- Seat availability
- Boarding point
- Dropping point

Users should be able to compare and proceed through supported booking workflows.

24. CAB AND TAXI DISCOVERY

Features:

- Pickup location
- Drop location
- Date and time
- Vehicle type
- Local cab

- Airport transfer
- Outstation travel
- One-way cab
- Round-trip cab
- Estimated or confirmed fare

Cab booking will depend on provider integrations and availability.

25. OWN VEHICLE AND RENTAL VEHICLE OPTIONS

Users may select their own vehicle rather than booking public transportation.

Rental vehicle discovery may also be provided where suitable partner integrations are available.

26. ACCOMMODATION DISCOVERY

Ghoomi will provide accommodation discovery for:

- Hotels
- Resorts
- Homestays
- Hostels
- Lodges
- Guest Houses

Users should be able to search based on:

- Destination
- Check-in
- Check-out
- Guests
- Rooms
- Budget
- Accommodation Type

27. HOTEL AND RESORT COMPARISON

Hotel listings should display:

- Property Name
- Images
- Location
- Room Type

- Price
- Amenities
- Ratings
- Reviews
- Availability
- Check-in and Check-out Information
- Cancellation Conditions

The user should be able to compare multiple properties and choose the most suitable option.

The discovery experience should follow the familiar marketplace model used by established accommodation platforms, while actual data and booking actions will come from authorized provider integrations.

28. FOOD AND RESTAURANT DISCOVERY

The food module should support discovery of:

- Indian Food
- Chinese Food
- Regional Cuisine
- Budget Restaurants
- Premium Restaurants
- Cafes
- Family Restaurants
- Local Food Experiences

Information:

- Restaurant Name
- Menu
- Location
- Price Range
- Ratings
- Reviews
- Images
- Opening Hours
- Available Services

Food ordering and restaurant reservations may be introduced through suitable integrations.

29. ACTIVITIES AND ATTRACTIONS DISCOVERY

The platform should provide information about:

- Tourist Attractions
- Historical Places

- Museums
- Adventure Activities
- Theme Parks
- Shopping Areas
- Entertainment
- Family Activities
- Local Experiences

Users should be able to discover activities based on their destination and interests.

30. DESTINATION INFORMATION

Each destination should have an information page containing:

- Destination Overview
- Popular Attractions
- Hotels
- Restaurants
- Activities
- Local Transportation
- Travel Information
- Images
- Basic Travel Tips

31. TRIP CUSTOMIZATION

Users must be able to customize their AI-generated or manually created trip.

They should be able to:

- Add places
- Remove places
- Change hotels
- Change transport
- Modify dates
- Change activities
- Adjust budget
- Select food preferences
- Change trip duration
- Rearrange itinerary

AI should be able to regenerate relevant recommendations after a major modification.

32. UNIFIED TRIP DASHBOARD

Priority: P0 — Core Feature

The unified dashboard will bring all essential trip information together.

It should display:

- Trip Name
- Starting Location
- Destination
- Travel Dates
- Number of Travellers
- Selected Transportation
- Accommodation Details
- Food Plans
- Activities
- Day-wise Itinerary
- Estimated Budget
- Booking Information
- Important Notifications
- Basic Safety Information

The dashboard should provide access to each selected service without requiring the user to search again.

33. BASIC BOOKING AND RESERVATION INTEGRATION

The first deployment should support actual booking wherever authorized partner integrations are available.

This may include:

- Flight reservation
- Train reservation
- Bus reservation
- Cab reservation
- Hotel reservation
- Activity reservation

Booking workflows may use:

1. Provider APIs.
2. Authorized embedded booking interfaces.
3. Secure provider redirects.
4. Other contractually permitted booking methods.

The selected integration method should be clearly identified.

A search result or redirect must not be presented as a confirmed Ghoomi booking unless the provider confirms the reservation and provides a valid booking reference.

34. BASIC PAYMENT AND COST SUMMARY

The first deployment should provide the payment capabilities necessary for its supported booking integrations.

Possible functions:

- Display provider price
- Display applicable taxes
- Display platform charges
- Calculate total payable amount
- Initiate supported payments
- Receive payment status
- Display transaction reference

The platform should support payment processing through authorized payment providers.

Where a provider processes its own payment, Ghoomi should clearly communicate the payment responsibility and confirmation flow.

35. BASIC SAFETY FEATURES

Priority: P1 — Important for Initial Launch

The first version should include basic safety facilities:

- Emergency Contact Entry
- Emergency Contact Details
- Important Local Emergency Information
- Emergency Service Directory
- Basic Safety Instructions
- Safety Information in Trip Dashboard

Advanced location tracking, SOS automation and family monitoring will be developed in Partition 2 or Partition 3.

36. BASIC NOTIFICATIONS

The initial version should provide:

- Account Verification

- Trip Creation Confirmation
- Booking Request Updates
- Booking Confirmation
- Payment Status
- Important Trip Reminders
- Support Ticket Updates

Channels may include in-app, email and SMS according to the selected integration.

37. BASIC CUSTOMER SUPPORT

Users should be able to:

- Contact Support
- Raise Complaints
- Select Complaint Categories
- Submit Booking References
- Describe Problems
- View Ticket Status

A basic support management system should be available to administrators.

38. ADMIN DASHBOARD

The initial admin panel should manage:

- Users
- Trips
- Bookings
- Partners
- Destination Content
- Service Listings
- Payments
- Support Tickets
- Basic Reports
- User Access
- Platform Configuration

Administrative access should be role-based.

39. INITIAL PARTNER INTEGRATION

Ghoomi should initially work with selected authorized partners.

Partner categories:

- Flight Providers
- Train Booking Providers
- Bus Operators
- Hotel Providers
- Cab Operators
- Restaurant Providers
- Activity Providers

The initial partner integration should prioritize reliable search, availability information, booking references and status synchronization.

40. PARTITION 1 PAGE-WISE DEVELOPMENT STRUCTURE

The first deployment pages should be developed in the following order.

40.1 Phase 1 — Website Foundation

No.	Page	Main Function
1	Landing Page	Main website
2	Sign Up	Registration
3	Login	Authentication
4	Forgot Password	Account recovery
5	Verification	Email/mobile verification
6	User Profile	Profile information
7	Main Dashboard	User overview

40.2 Phase 2 — Trip Creation & AI Planning

No.	Page	Main Function
8	Destination Search	Search destinations
9	Destination Details	Destination information
10	Create Trip	Trip creation
11	Traveller Details	Traveller information
12	AI Trip Planner	Personalized planning
13	AI Itinerary	Day-wise plan
14	Budget Estimation	Cost calculation
15	Trip Customization	Modify selected plans
16	My Trips	Saved trips
17	Unified Trip Dashboard	Complete trip overview

40.3 Phase 3 — Transportation

No.	Page	Main Function
18	Transportation Home	Transport categories
19	Flight Search	Search flights
20	Flight Results	Compare flights
21	Flight Details	Selected flight

22	Train Search	Search trains
23	Train Results	Compare trains
24	Train Details	Selected train
25	Bus Search	Search buses
26	Bus Results	Compare buses
27	Bus Details	Selected bus
28	Cab Search	Search cabs
29	Cab Results	Compare cabs
30	Cab Details	Selected cab
31	Own Vehicle	Personal vehicle option

40.4 Phase 4 — Accommodation

No.	Page	Main Function
32	Hotel Search	Search accommodation
33	Hotel Results	Compare stays
34	Hotel Details	Property information
35	Room Selection	Select room
36	Guest Details	Guest information
37	Hotel Booking Flow	Supported booking
38	Hotel Confirmation	Booking result

40.5 Phase 5 — Food and Activities

No.	Page	Main Function
39	Food Discovery	Food categories
40	Restaurant Listing	Restaurant search
41	Restaurant Details	Menu and information
42	Activities	Activity discovery
43	Activity Details	Activity information
44	Destination Explore	Places and attractions

40.6 Phase 6 — Booking and Operations

No.	Page	Main Function
45	Booking Summary	Selected services
46	Payment	Supported payment
47	Payment Status	Transaction status
48	Booking Confirmation	Provider confirmation
49	My Bookings	Booking overview
50	Booking Details	Reservation details
51	Basic Safety	Emergency information
52	Notifications	Important updates
53	Customer Support	User assistance
54	Admin Dashboard	Platform operations
55	Partner Management	Initial partner records

41. PARTITION 1 TECHNICAL REQUIREMENTS

The first deployment must include:

Frontend

- Responsive website
- Reusable UI components
- Search forms
- Filters and sorting
- User dashboard
- Trip dashboard
- Booking screens
- Error and loading states

Backend

- Authentication
- User management
- Trip management
- Search services
- AI planning integration
- Budget calculation
- Booking orchestration
- Payment status handling
- Notification services
- Admin APIs

Database

- Users
- Profiles
- Travellers
- Trips
- Trip Members
- Itineraries
- Search Records where needed
- Transport Providers
- Accommodation Providers
- Bookings
- Payments
- Partners
- Notifications
- Support Tickets

External Integrations

- Flight search provider
- Railway integration

- Bus provider
- Cab provider
- Hotel provider
- Maps
- AI API
- Payment gateway
- Email/SMS provider

Failure Handling

- API timeout handling
- Invalid response handling
- No availability handling
- Failed booking handling
- Duplicate booking prevention
- Payment failure handling
- Retry mechanisms
- Error logging
- User-friendly error messages

42. PARTITION 1 PRIORITY AND DEVELOPMENT SEQUENCE

Priority	Modules	Development Importance
P0	Authentication and User Profile	Critical
P0	Trip Creation	Critical
P0	AI Trip Planning	Critical
P0	AI Itinerary	Critical
P0	Budget Estimation	Critical
P0	Transportation Discovery	Critical
P0	Accommodation Discovery	Critical
P0	Unified Trip Dashboard	Critical
P0	Database and Backend	Critical
P0	Initial API Integrations	Critical
P1	Food Discovery	High
P1	Activities and Attractions	High
P1	Basic Booking Workflows	High
P1	Basic Payment Support	High
P1	Basic Safety	High
P1	Notifications and Support	High
P1	Admin and Partner Operations	High

43. FIRST DEPLOYMENT COMPLETION CRITERIA

Partition 1 will be ready for deployment when:

1. Users can register and log in.
2. Users can create and save trips.
3. Users can enter their travel preferences.
4. AI can generate useful itineraries.
5. Budget estimates can be calculated.
6. Users can compare transportation options.
7. Users can discover accommodation.
8. Users can explore restaurants and activities.
9. Users can customize their trips.
10. The unified trip dashboard displays the correct information.
11. Supported booking integrations work correctly.
12. Payment status is handled accurately where payments are integrated.
13. Admins can manage essential operations.
14. API failures are handled properly.
15. Security and privacy requirements are implemented.
16. Desktop and mobile interfaces are tested.
17. End-to-end user workflows pass testing.

PART C — PARTITION 2: AFTER FIRST DEPLOYMENT

44. PARTITION 2 OVERVIEW

Development Stage: Operational Expansion

Priority: P1 / P2 — Post-Launch Improvements

After the first deployment, Ghoomi will be improved using real user feedback, operational data and partner requirements.

The focus will move from basic discovery and planning towards a stronger booking, payment and journey management ecosystem.

45. EXPANDED DIRECT BOOKING SYSTEM

Ghoomi will expand its direct booking capabilities.

Potential additions:

- More flight providers
- More railway and bus booking integrations
- More cab partners
- More hotel partners
- Direct reservation management
- Booking modification support
- Provider status synchronization
- Booking confirmation tracking
- Booking reference management

The booking system should use a common internal booking model while respecting the different requirements of each provider.

46. ADVANCED PAYMENT MANAGEMENT

Additional payment features:

- Multiple payment methods
- Payment transaction history
- Payment reconciliation
- Payment failure recovery
- Payment reference management
- Provider settlement tracking
- Platform fee calculation
- Commission tracking
- Payment notifications

The platform should never assume that a payment is successful merely because the user returns from a payment page. Verified gateway confirmation is required.

47. BOOKING LIFECYCLE MANAGEMENT

Ghoomi will implement a more complete booking lifecycle.

Search → Availability Check → Reservation Request → Payment → Provider Confirmation → Booking Management → Modification / Cancellation → Completion

Every booking should have an internal Ghoomi reference and the relevant external provider reference.

The system must maintain accurate booking status.

48. CANCELLATION AND REFUND MANAGEMENT

Features:

- Cancellation Request
- Policy Retrieval
- Cancellation Fee Calculation
- Refund Eligibility
- Refund Status
- Provider Confirmation
- Payment Gateway Status
- User Notifications

Applicable cancellation charges, taxes, provider fees and platform fees should be displayed transparently.

Ghoomi should apply only the charges supported by the relevant agreements and applicable law.

49. GROUP TRAVEL COORDINATION

Features:

- Create Group
- Invite Members
- Add Members to Trip
- Group Roles
- Shared Itinerary
- Group Notifications
- Trip Participation
- Member Permissions
- Group Updates

The trip owner should control important changes.

50. FAMILY MONITORING AND LOCATION SHARING

Authorized family members or trusted contacts may receive selected travel updates.

Features:

- Emergency Contact Verification
- Trusted Contact Invitation

- Location Sharing Consent
- Location Sharing Duration
- Location Access Permissions
- Trip Start Notifications
- Arrival Notifications
- Delay Notifications
- Stop / Revoke Location Sharing

Location sharing should only operate with explicit consent and clear visibility.

51. LIVE TRIP UPDATES

The system should provide live or frequently synchronized travel information where providers support it.

Possible updates:

- Departure
- Arrival
- Delay
- Booking Status
- Hotel Check-in
- Activity Schedule
- Journey Progress
- Important Trip Changes

If live data is unavailable, the platform must display the last verified update rather than pretending that the information is real-time.

52. ADVANCED TRIP TRACKING

A visual trip timeline can show:

Home → Station → Transportation → Destination → Hotel → Activities → Return Journey → Home

Features:

- Current journey stage
- Location information
- Upcoming stages
- Completed stages
- Estimated arrival
- Delay information
- Timeline updates

Location information should be displayed only according to user permissions and available device data.

53. DOCUMENT STORAGE

Ghoomi can introduce a document storage facility for booking-related documents.

Possible uploads:

- Passenger documents
- Identity documents
- Booking-related files
- Required certificates
- Other documents requested by a provider

The system should validate file types, file size and user permissions.

Sensitive files must be encrypted and protected from unauthorized access.

54. ADVANCED NOTIFICATIONS

The notification system can expand to:

- In-App Notifications
- Push Notifications
- Email
- SMS
- WhatsApp Business integration where authorized
- Booking Updates
- Travel Reminders
- Family Updates
- Delay Alerts
- Cancellation Alerts
- Refund Notifications
- Support Updates

Users should be able to configure notification preferences.

55. ADVANCED CUSTOMER SUPPORT

Features:

- Live Chat where available
- Complaint Management
- Booking Dispute Management
- Support Ticket Tracking

- Escalation
- Partner Support Coordination
- Refund Assistance
- Frequently Asked Questions
- Support History

56. PARTNER MANAGEMENT EXPANSION

Partner features:

- Partner Registration
- Verification
- Partner Login
- Service Listing
- Inventory Management
- Price Management
- Booking Requests
- Booking Status
- Cancellation Requests
- Commission Reports
- Performance Information

57. ADVANCED ADMIN DASHBOARD

The admin system should provide:

- User Management
- Trip Management
- Booking Monitoring
- Transaction Monitoring
- Refund Management
- Partner Verification
- Partner Performance
- Commission Management
- Complaint Management
- Content Moderation
- Service Availability
- API Health
- Basic Business Analytics

58. PARTITION 2 PAGE-WISE DEVELOPMENT STRUCTURE

No.	Page / Module	Function
1	Advanced Booking Dashboard	Expanded reservations
2	Booking Modification Page	Change eligible bookings

3	Cancellation Management	Cancellation workflows
4	Refund Dashboard	Refund tracking
5	Payment Management	Advanced payment records
6	Transaction Details	Transaction information
7	Group Travel Dashboard	Group coordination
8	Group Members Page	Member management
9	Family Monitoring Dashboard	Authorized monitoring
10	Location Sharing Settings	Permissions and duration
11	Live Trip Dashboard	Journey updates
12	Trip Timeline	Journey stages
13	Document Upload Page	Document storage
14	Document Management Page	Stored document access
15	Notification Settings	Notification preferences
16	Advanced Support Page	Improved support
17	Partner Dashboard	Partner operations
18	Partner Inventory Page	Availability and services
19	Partner Booking Page	Booking management
20	Advanced Admin Dashboard	Platform administration
21	Commission Management	Partner revenue
22	API Monitoring Dashboard	Integration health

59. PARTITION 2 TECHNICAL REQUIREMENTS

API and Integration

- Expanded provider integrations
- Booking webhooks
- Payment webhooks
- Provider synchronization
- Idempotent booking requests
- Booking reconciliation
- Refund status synchronization

Database

- Group Members
- Location Sharing Permissions
- Trip Events
- Booking Modifications
- Cancellation Records
- Refund Records
- Documents
- Notification Preferences
- Partner Inventory
- Partner Settlements

Security

- Role-based access
- Consent records
- Encrypted documents
- Restricted location access
- Audit logs
- Secure payment verification

Failure Handling

- Duplicate booking protection
- Payment and booking mismatch detection
- Refund reconciliation
- Provider timeout handling
- Delayed webhook handling
- Retry and manual review workflows

60. PARTITION 2 PRIORITY AND DEVELOPMENT SEQUENCE

Priority	Feature	Importance
P1	Expanded Booking	High
P1	Payment Management	High
P1	Cancellation and Refund	High
P1	Booking Lifecycle	High
P1	Partner Management	High
P2	Group Coordination	Medium-High
P2	Family Monitoring	Medium-High
P2	Live Trip Updates	Medium-High
P2	Document Storage	Medium
P2	Advanced Support	Medium

PART D — PARTITION 3: LONG-TERM EXPANSION

61. PARTITION 3 OVERVIEW

Development Stage: Advanced Intelligent Travel Ecosystem

Priority: P2 / P3 — Long-Term Development

This partition contains the advanced features that will differentiate Ghoomi from conventional travel booking platforms.

These features should be developed only after the core platform and its operational systems are stable.

62. INTELLIGENT TRIP RECOVERY

Priority: P3

Ghoomi should eventually identify unexpected disruptions and help reorganize the affected journey.

Possible situations:

- Train delay
- Flight delay
- Cab unavailability
- Hotel booking failure
- Activity cancellation
- Weather disruption
- Missed connection
- Unexpected travel schedule change

Intelligent Recovery Workflow

1. Detect the issue.
2. Identify affected bookings.
3. Analyze the remaining itinerary.
4. Search alternative transportation.
5. Check accommodation changes.
6. Identify activity rescheduling requirements.
7. Calculate additional expenses.
8. Generate an updated trip plan.
9. Present alternatives to the user.
10. Obtain user approval before paid changes.
11. Execute supported modifications.
12. Update the trip dashboard.

63. BACK-TO-HOME SYSTEM

Priority: P3

Back-to-Home is a future Ghoomi feature that helps a traveller arrange an early return home.

Possible reasons:

- Emergency
- Personal reasons
- Safety concerns

- Family requirements
- Health-related situations
- Change in travel preference

Back-to-Home Workflow

1. User selects Back-to-Home.
2. System identifies the current location.
3. Remaining bookings are identified.
4. Cancellation policies are checked.
5. Possible refunds and charges are estimated.
6. Alternative return transportation is searched.
7. A new return itinerary is generated.
8. Additional expenses are calculated.
9. User approves the proposed changes.
10. Eligible booking modifications are processed.
11. Trusted contacts are notified according to permission.

Back-to-Home must not automatically cancel paid bookings or make new paid bookings without user approval.

64. ADVANCED SAFETY COORDINATION

Priority: P3

Features:

- Emergency Contact Verification
- Trusted Contact Management
- Location Sharing Consent
- Location Sharing Duration
- SOS Workflow
- Trusted Contact Notifications
- Emergency Service Directory
- Location Sharing Stop / Revoke
- Incident History
- False SOS Handling

65. EMERGENCY AND SOS ECOSYSTEM

The SOS system should provide an organized emergency workflow.

Possible process:

1. User activates SOS.
2. System identifies the active trip.
3. Available location is retrieved.

4. Trusted contacts are notified.
5. Emergency information is displayed.
6. Relevant emergency service details are provided.
7. Incident information is recorded.
8. Follow-up information is made available.

False SOS handling should allow accidental activation to be identified and cancelled where possible, without delaying legitimate emergency assistance.

Ghoomi should not claim that it directly dispatches emergency services unless a real authorized integration exists.

66. ADVANCED AI TRAVEL ASSISTANT

The AI assistant will become a context-aware travel assistant.

Example questions:

- Find a restaurant near my hotel.
- What should I visit tomorrow?
- I have ₹2,000 remaining. What can I do?
- My train is delayed. What should I change?
- Suggest another hotel.
- Reorganize today's activities.
- Find a suitable return journey.

The assistant should use authorized and relevant trip information, provider data and user permissions.

67. ADVANCED DESTINATION AND EVENT INTELLIGENCE

AI can analyze destination information using:

- Authorized event APIs
- Verified event listings
- Tourism sources
- Partner information
- Maps and location data
- Public information where permitted
- Historical event records
- Seasonal information

It can identify:

- Local Festivals
- Concerts

- Cultural Events
- Tourist Attractions
- Adventure Activities
- Shopping Events
- Local Experiences
- Seasonal Destinations

Digital advertisements may provide additional discovery information where access is permitted, but advertisements must not be treated as verified facts.

The system should prioritize reliable, current information and clearly distinguish sponsored listings.

68. ADVANCED WEATHER INTELLIGENCE

Features:

- Weather Forecast
- Rain Information
- Temperature
- Severe Weather Alerts
- Outdoor Activity Suitability
- Alternative Indoor Activities
- Weather-Based Itinerary Suggestions

If conditions are unsuitable, AI can recommend postponing or replacing outdoor activities.

Official weather alerts should be used wherever available.

69. ADVANCED GROUP EXPENSE SPLITTING

Priority: P3

Features:

- Add Group Expenses
- Category-Wise Expenses
- Member-Wise Distribution
- Paid Amount
- Pending Payments
- Settlement Calculation
- Remaining Budget
- Expense Reports
- Group Expense History

Example:

Member	Paid Amount	Share	Balance
Member A	₹5,000	₹3,000	+₹2,000
Member B	₹2,000	₹3,000	-₹1,000
Member C	₹2,000	₹3,000	-₹1,000

The system should calculate who owes whom.

70. OFFLINE TRAVEL MODE

Priority: P3

The offline mode should allow access to selected saved trip information without an internet connection.

Possible information:

- Tickets
- Booking References
- Saved Itinerary
- Hotel Details
- Emergency Contacts
- Important Instructions
- Saved Documents
- Downloaded Maps where supported

Live availability, real-time prices, new bookings and live AI recommendations will require internet connectivity.

The system should display the last synchronization timestamp.

71. SECURE DOCUMENT WALLET

Priority: P3

The future document wallet will provide centralized document access.

Possible documents:

- Passport
- Identity Documents
- Travel Tickets
- Booking Documents
- Required Certificates
- Other Travel-Related Documents

Security requirements:

- Encryption
- Secure Storage
- Access Permissions
- Document Validation
- Download Controls
- Retention Policies
- Deletion Controls
- Access Logs

The system should not collect or store sensitive documents without a legitimate service requirement and user consent.

72. PUBLIC TRAVEL EXPERIENCES

Priority: P3

Users may publish selected trips as public travel experiences.

Information may include:

- Destination
- Duration
- Approximate Budget
- Places Visited
- Activities
- Photos
- Videos
- Itinerary
- Recommendations
- Reviews

Users should decide whether a trip is private, shared with selected people or public.

73. TRAVEL MEMORIES AND SOCIAL COMMUNITY

The platform can gradually develop a travel content ecosystem.

Features:

- Travel Photos
- Travel Videos
- Reels
- Trip Memories
- Travel Stories
- Destination Guides
- Travel Tips

- Public Itineraries
- User Reviews
- Community Discussions

With explicit permission, selected public travel content may be shared on Ghoomi's official YouTube and other social media platforms.

74. GHOOMI EXPLORE

Ghoomi Explore will be a dedicated discovery area.

It can show:

- Trending Destinations
- Public Trips
- Travel Stories
- Local Experiences
- Budget Trips
- Popular Activities
- User Recommendations
- Travel Guides
- Community Content

75. ADVANCED PARTNER MARKETPLACE

The future marketplace may include:

- Hotels
- Resorts
- Restaurants
- Cab Operators
- Transportation Companies
- Activity Providers
- Event Organizers
- Local Experience Providers
- Tourism Businesses

Partner facilities may include:

- Self-Registration
- Verification
- Service Listings
- Inventory Management
- Pricing Management
- Booking Management
- Commission Records
- Reports

- Promotions
- Performance Analytics

76. PREMIUM MEMBERSHIP

Ghoomi may introduce optional paid membership plans.

Possible benefits:

- Advanced AI Planning
- Premium Recommendations
- Additional Travel Assistance
- Exclusive Offers
- Advanced Trip Management
- Special Partner Benefits

Pricing and membership benefits should be decided after validating demand.

77. ADVANCED FINANCIAL ECOSYSTEM

Potential features:

- Advanced Payment Coordination
- Group Expense Management
- Partner Settlements
- Advanced Refund Tracking
- Commission Reports
- Financial Analytics
- Premium Service Charges

A combined payment for multiple independent providers should only be introduced where the contractual and technical arrangements permit it.

78. FUTURE ANALYTICS AND INTELLIGENCE

The advanced admin system may provide:

- User Growth
- Active Trips
- Booking Conversion
- Popular Destinations
- Partner Performance
- Cancellation Rates
- Refund Trends
- Revenue
- Commission

- Customer Satisfaction
- Service Failure Rates
- AI Recommendation Performance
- Safety Incident Statistics

79. PARTITION 3 PAGE-WISE DEVELOPMENT STRUCTURE

No.	Page / Module	Function
1	Intelligent Trip Recovery Dashboard	Manage travel disruptions
2	Alternative Search Page	Find replacements
3	Recovery Cost Page	Calculate additional costs
4	Back-to-Home Dashboard	Return journey
5	Return Booking Page	Supported return arrangements
6	Safety Centre	Safety management
7	SOS Dashboard	Emergency workflow
8	Trusted Contacts Page	Contact management
9	Advanced AI Assistant	Contextual assistance
10	Event Discovery Page	Event recommendations
11	Weather Intelligence Page	Weather-based planning
12	Group Expense Dashboard	Expense distribution
13	Offline Travel Page	Saved offline information
14	Secure Document Wallet	Document management
15	Ghoomi Explore	Public trip discovery
16	Travel Memories Page	Photos and videos
17	Community Page	Travel discussions
18	Public Trip Details	Shared itineraries
19	Premium Membership Page	Membership
20	Advanced Partner Marketplace	Partner discovery
21	Partner Analytics	Business reports
22	Advanced Admin Analytics	Platform intelligence

80. PARTITION 3 TECHNICAL REQUIREMENTS

Potential technical systems:

System	Purpose
AI Recommendation Engine	Personalized suggestions
Trip Recovery Engine	Disruption management
Event Processing	Background trip events
Real-Time Location Service	Location updates
Notification Engine	Emergency and travel alerts
Offline Data Layer	Saved trip information
Secure Document Service	Encrypted documents
Social Content Service	Public travel content
Partner Marketplace	Provider ecosystem

Analytics Engine	Business intelligence
Feature Flags	Controlled feature releases
Monitoring System	Platform health

The architecture should expand only when actual scale and product requirements justify the additional complexity.

81. PARTITION 3 PRIORITY AND DEVELOPMENT SEQUENCE

Priority	Feature	Development Importance
P2	Advanced AI Assistant	High Future Priority
P2	Destination Intelligence	High Future Priority
P2	Weather Intelligence	High Future Priority
P2	Advanced Safety	High Future Priority
P3	Intelligent Trip Recovery	Long-Term
P3	Back-to-Home	Long-Term
P3	Group Expense Splitting	Long-Term
P3	Offline Mode	Long-Term
P3	Secure Document Wallet	Long-Term
P3	Social Community	Long-Term
P3	Partner Marketplace	Long-Term
P3	Premium Membership	Long-Term
P3	Advanced Analytics	Long-Term

PART E — CROSS-PLATFORM TECHNICAL, OPERATIONAL & BUSINESS REQUIREMENTS

82. API MANAGEMENT AND INTEGRATION ARCHITECTURE

Ghoomi will depend on external APIs for many travel services.

The integration layer should handle:

- API Authentication
- API Key Management
- Provider Requests
- Provider Responses
- Data Normalization
- Request Validation
- Rate Limits

- Timeout Handling
- Retry Logic
- Error Logging
- Webhook Processing
- Provider Status Synchronization

Each provider may have different data structures and booking processes.

Ghoomi should convert external responses into a common internal format.

83. DATABASE ARCHITECTURE

The database should be modular and relational wherever appropriate.

Main entities:

Entity	Purpose
Users	Accounts
Profiles	Personal information
Travellers	Passenger records
Trips	Trip information
Trip Members	Group participation
Itineraries	Travel schedules
Destinations	Destination information
Providers	External service providers
Transport Services	Transport listings
Accommodation	Hotel and stay records
Restaurants	Restaurant information
Activities	Activity information
Bookings	Reservations
Payments	Transactions
Refunds	Refund records
Notifications	Alerts
Documents	Document metadata
Support Tickets	Complaints
Partners	Business partners
Admins	Platform administrators
Location Permissions	Consent records
Expenses	Group expenses
Reviews	User feedback

Database relationships should use foreign keys, appropriate indexes, validation and transaction controls.

84. AUTHENTICATION AND AUTHORIZATION

The system should implement:

- Secure Registration
- Password Hashing
- JWT or secure session management
- Token Expiration
- Refresh Token Handling where required
- Role-Based Access Control
- Protected APIs
- Session Revocation
- Account Recovery

85. PERMISSION AND ACCESS MANAGEMENT

Different users must have different access levels.

Role	Main Permissions
User	Personal trips and bookings
Trip Owner	Manage selected trip
Group Member	Access permitted group information
Trusted Contact	View explicitly shared information
Partner	Manage authorized partner services
Support Staff	Handle assigned support cases
Admin	Manage authorized platform operations
Super Admin	Manage system-level settings

Sensitive operations must be restricted and logged.

86. AI INTEGRATION ARCHITECTURE

AI should be used for:

- Trip Planning
- Itinerary Generation
- Budget Estimation
- Budget Optimization
- Preference Matching
- Destination Recommendations
- Food Suggestions
- Activity Recommendations
- Future Trip Recovery
- Contextual Travel Assistance

The AI layer should use real structured information wherever required.

AI must not invent:

- Hotel availability
- Ticket prices
- Booking confirmations
- Event schedules
- Weather alerts
- Payment results

For important actions, AI should recommend options while the backend validates actual availability, price and booking conditions.

87. REAL-TIME DATA AND INVENTORY MANAGEMENT

Every important selection should trigger an appropriate availability and price revalidation.

For example:

1. User selects a hotel.
2. The system checks the latest available room information.
3. User proceeds towards booking.
4. The system checks again before confirming the reservation.
5. Provider confirmation is received.
6. Ghoomi updates the booking record.

The same principle applies to flights, trains, buses, cabs and activities.

Inventory should not be treated as permanently available simply because it appeared in an earlier search.

88. FAILURE HANDLING AND RECOVERY

The platform must handle unexpected errors safely.

Failure Scenario	Required Handling
API Timeout	Controlled retry and clear status
Provider Unavailable	Show alternative options
No Inventory	Display unavailable status
Price Changed	Recalculate and request approval
Booking Failed	Avoid false confirmation
Payment Failed	Display failure and recovery option
Duplicate Request	Prevent duplicate booking
Webhook Delayed	Reconcile booking status
Database Error	Transaction rollback where appropriate
File Upload Failure	Preserve clear error status

AI API Failure	Use fallback planning or manual selection
Location Unavailable	Display last known location and timestamp

Critical booking and payment operations should be designed to prevent duplicate charges and inconsistent records.

89. SECURITY AND PRIVACY

Security must apply to every partition.

Requirements:

- HTTPS
- Password Hashing
- Encryption in Transit
- Encryption at Rest
- Secure API Authentication
- Role-Based Access
- Restricted Document Access
- Secure File Uploads
- Audit Logs
- Database Backups
- Rate Limiting
- Input Validation
- Protection Against Common Web Vulnerabilities
- Monitoring
- Incident Response
- Data Retention and Deletion Policies

Location sharing and sensitive document access must be controlled by user permissions.

90. LEGAL AND COMPLIANCE REQUIREMENTS

Ghoomi must establish appropriate legal and operational documentation.

Possible requirements:

- Terms and Conditions
- Privacy Policy
- Cookie Policy where applicable
- Cancellation Policy
- Refund Policy
- Partner Agreements
- User Consent
- Location Sharing Consent
- Data Protection Procedures
- Payment Terms

- Commission Agreements
- Content Publishing Consent
- Complaint Handling
- Applicable Consumer Protection Compliance
- Applicable Indian Data Protection and IT Laws
- Relevant Payment and Travel Industry Requirements

The final legal structure should be reviewed by qualified legal professionals.

91. UI/UX AND RESPONSIVE DESIGN

The platform should provide a consistent user experience.

Requirements:

- Responsive Layout
- Desktop Support
- Tablet Support
- Mobile Support
- Clear Navigation
- Consistent Design System
- Reusable Components
- Loading States
- Empty States
- Error States
- Form Validation
- Accessibility
- Clear Booking Status
- Confirmation Dialogues
- User-Friendly Dashboards

Advanced offline interfaces and accessibility improvements can be expanded in later partitions.

92. TESTING AND QUALITY ASSURANCE

Testing must cover:

Functional Testing

- Registration
- Login
- Trip Creation
- Search
- Filters
- AI Planning
- Budget Calculation

- Booking
- Payment
- Dashboard

Integration Testing

- External APIs
- Payment Gateway
- Provider Webhooks
- Database
- Notifications

Security Testing

- Authentication
- Authorization
- Data Protection
- File Upload Security
- API Security

Performance Testing

- Search Response
- API Response
- Concurrent Users
- Database Performance

User Acceptance Testing

- Complete User Journey
- Mobile Experience
- Booking Workflow
- Error Handling
- Dashboard Usability

93. DEPLOYMENT AND INFRASTRUCTURE

Ghoomi should use a reliable deployment environment.

Requirements:

- Frontend Hosting
- Backend Hosting
- Managed Database
- Secure Environment Variables
- Domain and SSL
- Backup System
- Deployment Pipeline
- Monitoring

- Error Logging
- Rollback Strategy
- Staging Environment
- Production Environment

Development, testing and production environments should be kept separate.

94. MONITORING AND MAINTENANCE

After deployment, the team must monitor:

- Application Availability
- API Failures
- Booking Failures
- Payment Failures
- Database Performance
- Response Time
- Security Events
- User Complaints
- Provider Integration Health
- Error Rates

New features should be released through controlled deployments.

Existing functionality must be regression-tested before major updates.

95. FINAL PRODUCT VISION AND CONCLUSION

Ghoomi is planned as a three-part product development journey.

PARTITION 1 — BUILD THE FOUNDATION

The first deployment will establish the main travel platform.

It will include:

- User Accounts
- Destination Discovery
- Transportation Discovery
- Accommodation Discovery
- Holiday Planning
- AI Trip Planner
- AI Itinerary Generation
- AI Budget Estimation
- Trip Customization
- Food and Activity Discovery
- Unified Trip Dashboard

- Supported Booking Integrations
- Basic Payment Support
- Basic Safety
- Admin and Partner Foundation

The objective is to launch a functional and useful travel platform.

PARTITION 2 — EXPAND THE OPERATIONS

After the first deployment, Ghoomi will improve its operational capabilities through:

- Expanded Direct Bookings
- Advanced Payment Management
- Booking Lifecycle
- Cancellation and Refund
- Group Coordination
- Family Monitoring
- Live Trip Updates
- Advanced Tracking
- Document Storage
- Advanced Notifications
- Customer Support
- Partner Management

The objective is to make Ghoomi more capable of managing actual travel operations.

PARTITION 3 — BUILD THE COMPLETE ECOSYSTEM

The long-term vision includes:

- Intelligent Trip Recovery
- Back-to-Home
- Advanced Safety
- SOS
- AI Travel Assistant
- Destination Intelligence
- Weather Intelligence
- Group Expense Splitting
- Offline Travel
- Secure Document Wallet
- Public Travel Experiences
- Travel Memories
- Ghoomi Explore
- Social Community
- Partner Marketplace
- Premium Membership
- Advanced Financial Ecosystem
- Business Intelligence

The objective is to transform Ghoomi into a connected intelligent travel ecosystem.

FINAL PRODUCT STATEMENT

GHOOMI — FROM HOME TO HOME.

Ghoomi begins by bringing the essential travel planning and discovery services together in one platform.

The first version will focus on transportation, accommodation, food, activities, holiday planning, AI-generated itineraries, budget estimation, trip customization and a unified trip dashboard.

After deployment, the platform will expand its booking capabilities, payment operations, group coordination, family monitoring, live journey updates and document management.

In the long term, Ghoomi will introduce intelligent trip recovery, Back-to-Home, advanced safety, public travel experiences, a partner marketplace and a broader AI-powered travel ecosystem.

The three development partitions are connected. Each new stage will extend the existing platform while maintaining its original purpose.

Ghoomi is not intended to remain just another travel booking website. Its long-term purpose is to help users organize and manage the complete travel experience through one connected platform.

You Enjoy the Journey. Ghoomi Manages the Journey.

END OF GHOOMI MASTER PRODUCT VISION & THREE-PART DEVELOPMENT ROADMAP
